THE AI AGENT WORKFORCE A REGULATED ENTERPRISE CAN ACTUALLY DEPLOY

Agents pass the demo. *They fail the diligence review.*

"What did it do?"
AUDIT / ACCOUNTABILITY

"Could it exfiltrate our data?"
SECURITY / DATA BOUNDARY

"Will it get worse?"
DRIFT / ASSURANCE

Every AI-agent project in a regulated org hits the same three questions — and can't answer them. **Lightwork is the governed runtime that answers all three, on every action, before it runs** — self-hosted inside your environment, egress-locked, built to clear your security review.

Not a chatbot. Not a framework. A governed runtime — every action clears one gate before it happens: `capability → policy → shield → budget → audit`, on every tool call, payment, and write.

THREE THINGS NO ONE ELSE SHIPS

01

Governance on every action

A hard gate plus maker-checker on every action, with EU AI Act Article 14 holds — and every step on a signed, tamper-evident Operating Record. Prove what happened, to an auditor or a regulator.

02

Provable improvement

A closed, audited learning loop: the harness rewrites itself, proves each change lifts results on held-out work before it ships, and even the evaluator only improves against an immutable anchor. Signed, snapshotted, one command from rollback.

03

2,020 specialists, built in

A real workforce — 2,020 governed packs across 53 suites, each with a fixed job, a least-privilege tool set, a risk ceiling, and a human who signs off. Not a blank prompt box.

FOUR WAYS TO PUT GOVERNED AGENTS TO WORK

- **Lightwork Platform**
  The governed runtime and the Operating Record — the gate, the audit, the budget caps, the kill switch.
- **Fleet Governance & Memory**
  Govern the agents you didn't build — one oversight and memory plane for Agentforce, Copilot, in-house, and open-source agents.
- **Second Shift**
  Turnkey departments you switch on — Finance, Tax, Legal, +50 more. You don't prompt them; you turn them on.
- **Daybreak Forge**
  We author the bespoke department — custom packs, system-of-record connectors, validated fail-closed for regulated and air-gapped deployment.

WHAT YOU WON'T FIND ANYWHERE ELSE

It rewrites its own harness.
It mines its own failure traces into one minimal guidance line per weakness, regression-tests it on a held-out corpus, and only then promotes it — consolidating LLM-free, so it can't be prompt-steered.

It can't silently get worse.
Each learned change ships as a watched canary, graded on real outcomes and pulled automatically if it stops paying off. A hindsight engine catches regressions before they ship; every change is signed and one command from rollback.

It grounds itself in primary sources.
Analyst packs are auto-granted 37 read-only public-data connectors — SEC EDGAR, FRED, Treasury, CourtListener, openFDA, PubMed — so work cites an authoritative source, not model memory.

Your other agents answer to it.
One signed memory-and-oversight plane that Agentforce, Copilot, in-house, and open-source agents all deposit into, recall from, and are audited against — with value broken out per vendor.

We don't say it's governed. We show it.

Daybreak Labs · Lightwork · Private alpha — accepting a small number of design partners.
