Lightwork by Daybreak Labs

The governed AI workforce for regulated enterprises.

The agent platform a bank, insurer, or CPA firm can actually deploy — because every action is governed, provable, and self-hosted, and the workforce measurably improves without drifting.

Seed round · $ amount

Private alpha · installable today

The agent runtime is commoditizing. The *governance & proof layer* around it is the ownable business.

Frontier labs make agents smarter every month — that race is a treadmill. The durable company is built on what sits **around** the agent: governance bound to every action, an audit trail that can't be forged, and a workforce that improves under proof. In regulated industries that layer is the difference between a demo and a deployment — and **no one owns it.**

THE PROBLEM

Every regulated enterprise wants an agent workforce. Almost none can deploy one.

The blocker isn't capability — it's three questions no one can answer. So the pilot dies the moment the CISO, the compliance officer, and the GC walk in.

audit

“What did it do?”

No tamper-evident record of the actions an agent took.

security

“Could it exfiltrate our data?”

A hosted black box, or a framework the customer has to secure themselves.

drift

“Will it get worse?”

No proof it's improving instead of quietly degrading.

Today's options force a bad trade: **hosted black boxes** you can't run on your data, or **ungoverned frameworks** you have to secure yourself.

WHY NOW

Three forces converging in the next 24 months.

01 · regulation

“Ungoverned agent” becomes a non-starter

EU AI Act, HIPAA, SOX, GLBA. AI regulation is projected to reach the majority of the world's economies by 2030 — audit & oversight become mandatory, not optional.

02 · budget

Agents move from pilots to budget

Enterprise agent spend is being allocated — and stalling on exactly the governance gap between “works in a demo” and “cleared our review.”

03 · commoditization

The model layer is racing to zero-margin

Raw agent capability is commoditizing. Value — and defensibility — migrates to the governed layer around it.

Market context: analysts size AI-governance platforms growing to **$1B+ by 2030** (directional — validate at send).

THE SOLUTION

One governed runtime. Every action clears one gate.

Hand Lightwork a goal; a swarm of specialist agents works it — and every tool call, payment, and write passes one chokepoint before it happens, then lands where a human signs off.

01	02	03	04	05
Capability	**Policy**	**Shield**	**Budget**	**Audit**
Attenuate-only. Narrow, never widen.	Allow · deny · require a human.	Screens the dangerous call.	Hard $ / time / token caps.	Signed, offline-verifiable.

Self-hosted or air-gapped, on your data — so even a successful prompt injection can't move data out.

TRACTION — THE PRODUCT

This isn't a deck. It's built, installable, and provable today.

~310K	2,020	14 / 14	0
lines of code · 8 packages · installable today	governed specialist packs across 53 suites	core guarantees proven — reproducible, signed	required egress · runs in the customer's boundary

One command runs the golden path — a finance agent boots sealed, a $60k wire is **denied**, a $6k release **requires a human**, a runaway loop is **capped**, a tampered audit row is **caught** — and a signed proof-pack that reports “all hard guarantees hold” and refuses to fabricate a number it can't prove.

WHY IT'S DEFENSIBLE

Three reinforcing layers. All audited. None a prompt over an API.

01

Governance on every action

Attenuate-only capability tokens, a policy engine, an egress lock, and a signed hash-chained audit — deep infrastructure a competitor doesn't replicate in a quarter.

02

Provable, self-improving learning

The workforce gets better on its own — every change proven before it ships and reversible in one step, so it compounds without ever quietly drifting.

03

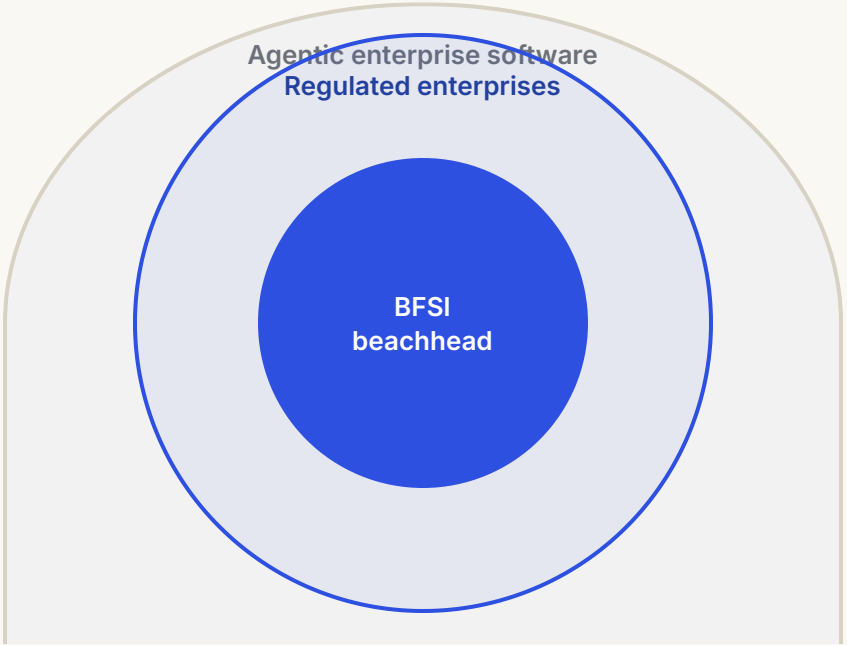

The 2,020-pack governed library

53 regulated suites, lint-clean, extended by an agent factory — and a hosted incumbent can't air-gap it into a bank.

Each customer's workforce improves on *their* data, inside *their* boundary — the switching cost is the moat, never a data network effect across customers.

MARKET

A big market — entered through a sharp wedge.

Bottoms-up, from the beachhead

- **~10,000** US regulated financial institutions in the beachhead.
- **100 customers × ~$250K ACV ≈ $25M ARR** from BFSI alone. validate
- **53 suites already built** for land-and-expand well beyond finance.
- Second wedge: **tax-prep for CPA firms** — a citation-backed docs→1040 pipeline.

Market-sizing figures are directional and re-confirmed before external use.

BUSINESS MODEL

Platform + packs + governance plane. Land, then expand.

Recurring software revenue with high gross margins; agent count is never a multiplier. Pricing is a directional hypothesis, validated with design partners.

REVENUE LINE	WHAT IT IS	WHO BUYS	ANCHOR ACV
Platform (Basic/Gold/Platinum)	The governed runtime + Operating Record	CISO · CIO · Head of Ops	$18K–$500K+
Specialist packs	Turnkey departments (Finance, Tax, Legal, …)	CFO · GC · function owner	$25K–$75K each
Fleet Governance	Govern agents they didn't build	CISO · platform team	$75K
Custom work (Daybreak Forge)	Bespoke departments & regulated deployment	Enterprise / regulated	from $25K

Example deals: Gold + Finance pack ≈ **$150K** · Platinum + Banking pack + Fleet Gov ≈ **$350K**. Expansion across 53 suites drives net revenue retention.

GO-TO-MARKET

Two motions into the same wedge.

motion 1 · direct

BFSI design partners → paid pilot → expand

Founder-led pilots on one governed workflow, in the customer's environment. Win the CISO with provable governance; expand across suites once the first department lands.

design partner → scoped pilot → paid platform → + packs

motion 2 · overlay

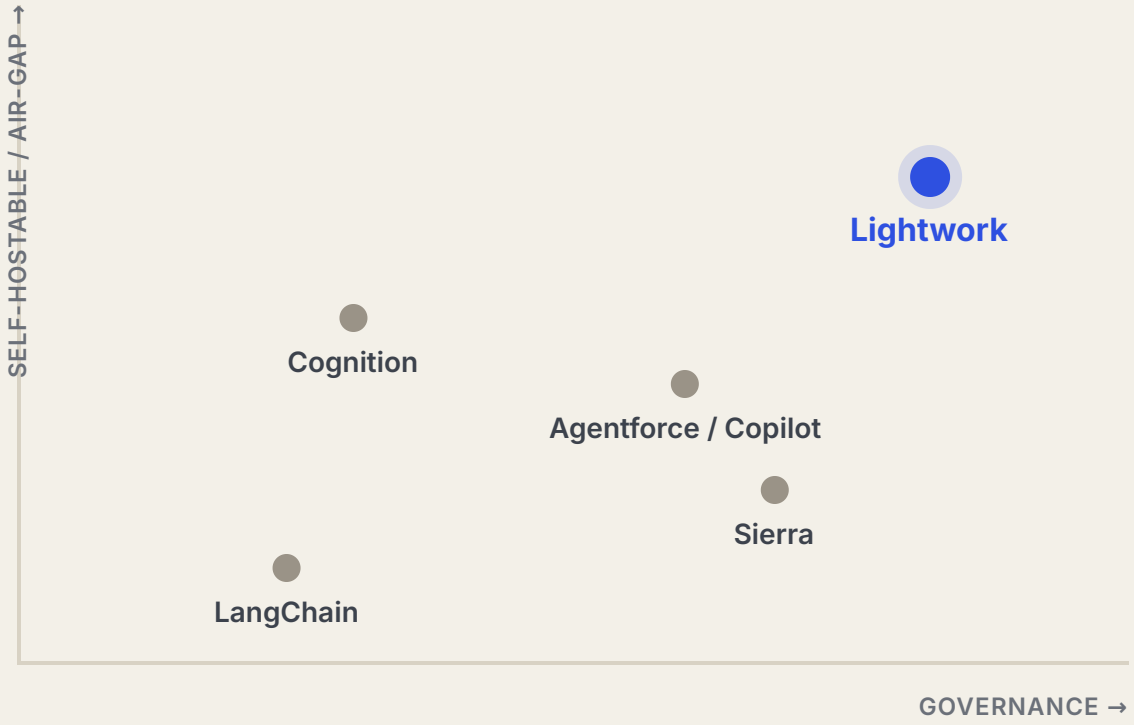

“Govern the agents you already have”

Bring existing Agentforce / Copilot / in-house / open-source agents under Lightwork's governance + memory plane. The easiest way in — and a natural acquisition story for a GRC / ServiceNow buyer.

their agents → Fleet Governance → full platform

COMPETITION

Nobody owns the top-right: governed *and* self-hostable, for regulated work.

- **Sierra** ($15.8B) — hosted CX agents; can't air-gap into a bank.
- **Cognition** — coding agents, not governed enterprise ops.
- **LangChain** — ungoverned plumbing you secure yourself.
- **Agentforce / Copilot** — incumbents with policy, but no agent-native, self-hostable governed runtime.

TRACTION

Built asset, early pull.

product

Shipped & provable

Installable today; 2,020 packs; reproducible signed proofs; a pre-answered security questionnaire that de-risks the CISO review.

commercial

Demand

design-partner conversations · LOIs · waitlist — the pull that converts a built asset into a round.

Fill with your real numbers: discovery calls booked, LOIs in progress, pilots scoped, inbound. Even a handful of serious BFSI/CPA conversations is a fundable signal.

TEAM

Why us.

founder

Christopher Day — Founder

background · the unfair insight / access into regulated buyers · why you win this

advisors / team

Around you

co-founder / key hires / advisors — security, BFSI, or GTM credibility

Founder-market fit is the #1 thing a pre-revenue investor underwrites — make this slide the sharpest in the deck.

THE ASK

Raising [$ amount] to turn a built asset into revenue.

Use of funds over 12–18 months, mapped to the milestones that set up a fundable Series A.
